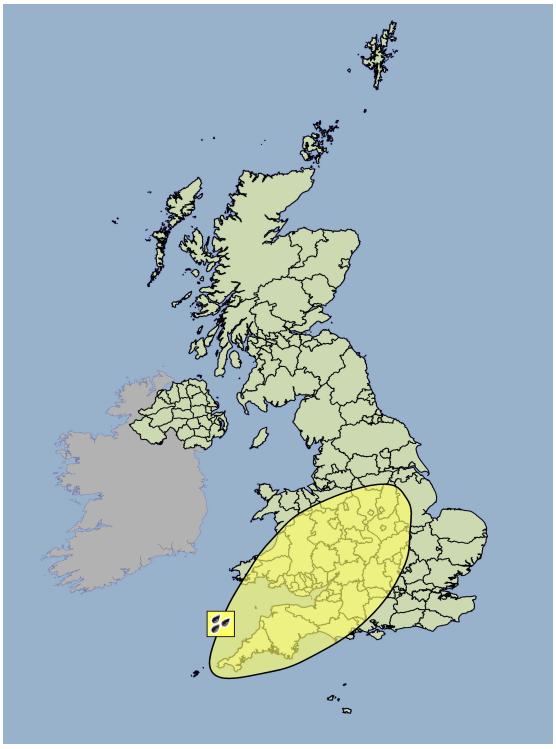
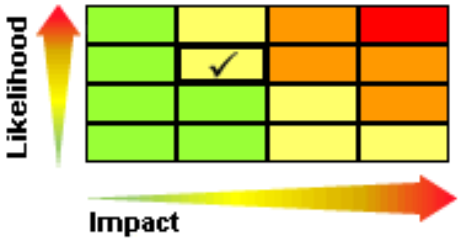
National Severe Weather Warning Service





Chief Forecasters Assessment
A developing small-scale low pressure system is expected to run northeastwards across southern and central areas of England during Tuesday and Tuesday night. An arc of heavy and persistent rain is expected to form on the northern and western flank, with anything from 20 to 60 mm falling in the space of 6 to 12 hours. The ground is relatively dry, and this will help guard against too many impacts, but road travel is likely to be inconvenienced locally. Strong winds may also combine with the heavy rainfall in places.

One other aspect of note is that it will be particularly cold through the afternoon and evening where rain is heaviest, even with the chance of seeing some wet snow in a few places.

At this stage there is considerable uncertainty in many of the details, and it is likely that the warning area will be refined and reduced in size as the event approaches.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **08:00 on Tue, 14th May 2013** until **23:59 on Tue, 14th May 2013**

The public should be aware that persistent and often heavy rainfall spreading from the southwest has the potential to cause some difficult driving conditions through Tuesday. Surface water flooding is likely on stretches of the road network, and in places strong winds will lead to considerable spray.
